

Manual Test Plan

OS Support:

Only Windows 10 running VS Code will be used for testing

First Run:

Go to the correct directory, then input

\$python main.py -h

In the terminal that is integrated.

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -h
usage: main.py [-h] [-u URL] [-a AUTHOR] [-b BOOK] [-rb READBOOK] [-ra READAUTHOR] [-eb EXBOOK] [-ea EXAUTHOR]

scrap book from URL and/or import/export JSON file to/from mongodb

optional arguments:
  -h, --help            show this help message and exit
  -u URL, --url URL      indicate the starting URL
  -a AUTHOR, --author AUTHOR
                        desired author count
  -b BOOK, --book BOOK   desired book count
  -rb READBOOK, --readbook READBOOK
                        read from book JSON file
  -ra READAUTHOR, --readauthor READAUTHOR
                        read from author JSON file
  -eb EXBOOK, --exbook EXBOOK
                        export the book database to JSON file
  -ea EXAUTHOR, --exauthor EXAUTHOR
                        export the author database to JSON file
PS C:\Users\mzhai4\cs242-digital_library>
```

You will see the following help message clarifying all those parameters.

If you entered a wrong URL, that is, either a wrong formatted one, or any valid URL that is not pointing to Goodreads and representing a book, you will receive the error message:

Case 1: Not a valid URL

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -u google.cooooom
URL is invalid
```

Case 2: Valid URL not pointing to Goodreads

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -u https://www.google.com
URL is invalid
```

Case 3: Valid Goodreads URL not representing a book

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -u https://www.goodreads.com/choiceawards/best-books-2020?int=gca_signed_out_hp
Will now try start scraping
URL is invalid
```

Case 4: Totally valid URL

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -u https://www.goodreads.com/book/show/3735293-clean-code
Will now try start scraping
```

Without other parameter, the scraper will start until 200 books or 50 authors has been collected.

If the author number is greater than 50

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -a 500  
Scraping until desired author number may take longer than expected.
```

If the book number is greater than 200

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -b 500  
Scraping until desired book number may take longer than expected.
```

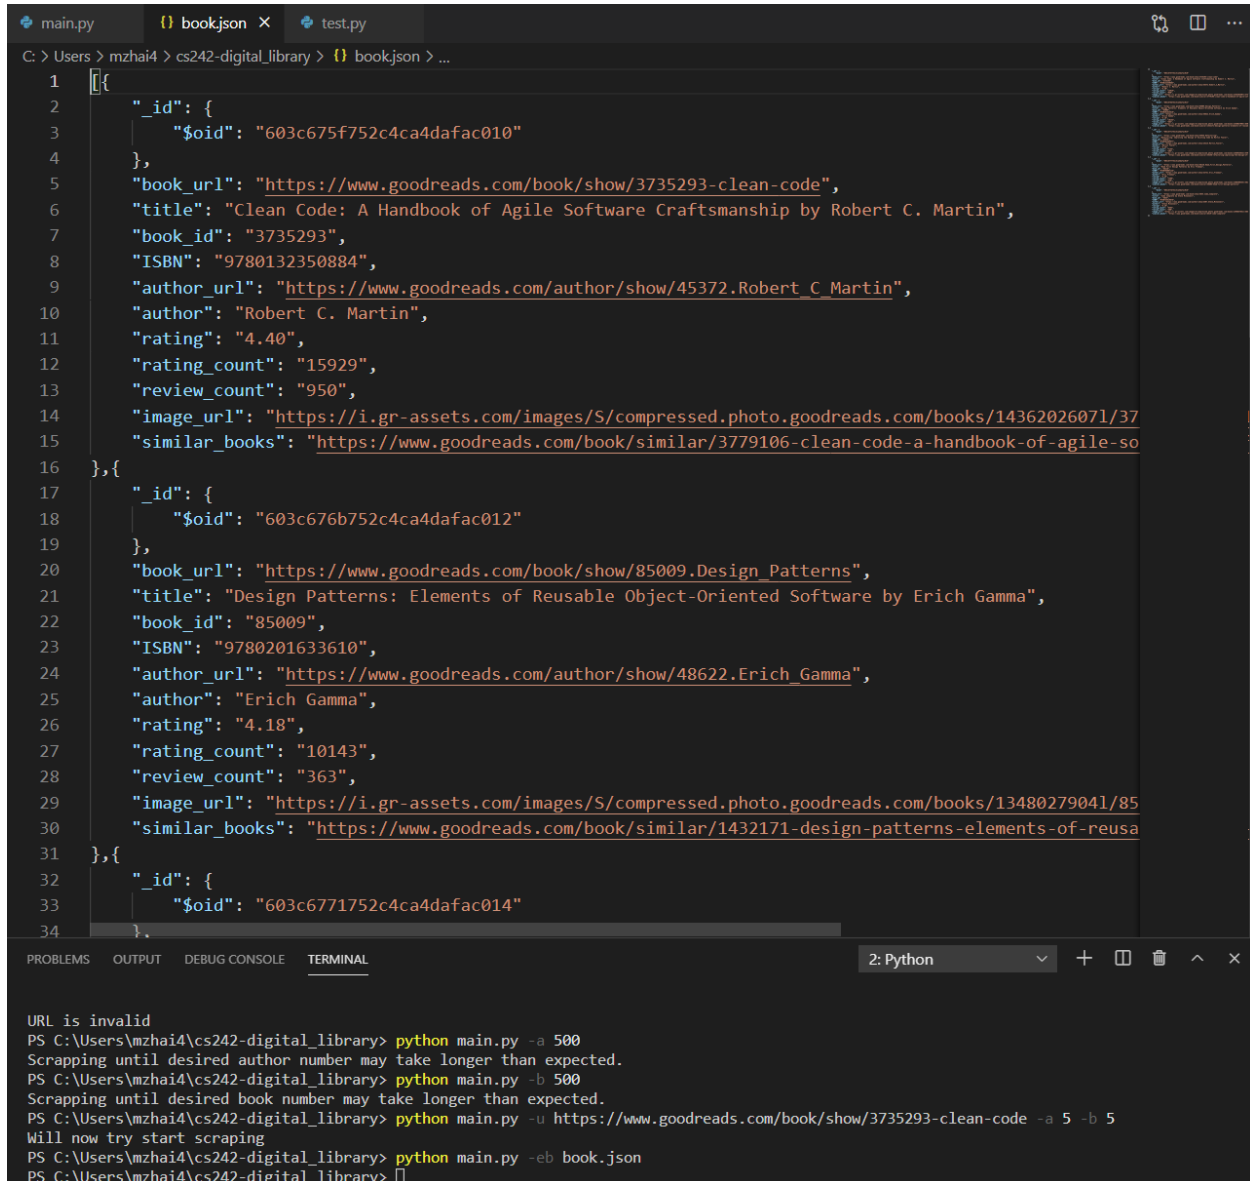

If the URL is valid, book and author number set to 5

```
PS C:\Users\mzhai4\cs242-digital_library> python main.py -u https://www.goodreads.com/book/show/3735293-clean-code -a 5 -b 5  
Will now try start scraping
```

It will soon finish scraping.

Now we can try to use `-eb` function to export the database to a json file.

Note that it will not fail even if the file name is not correct.

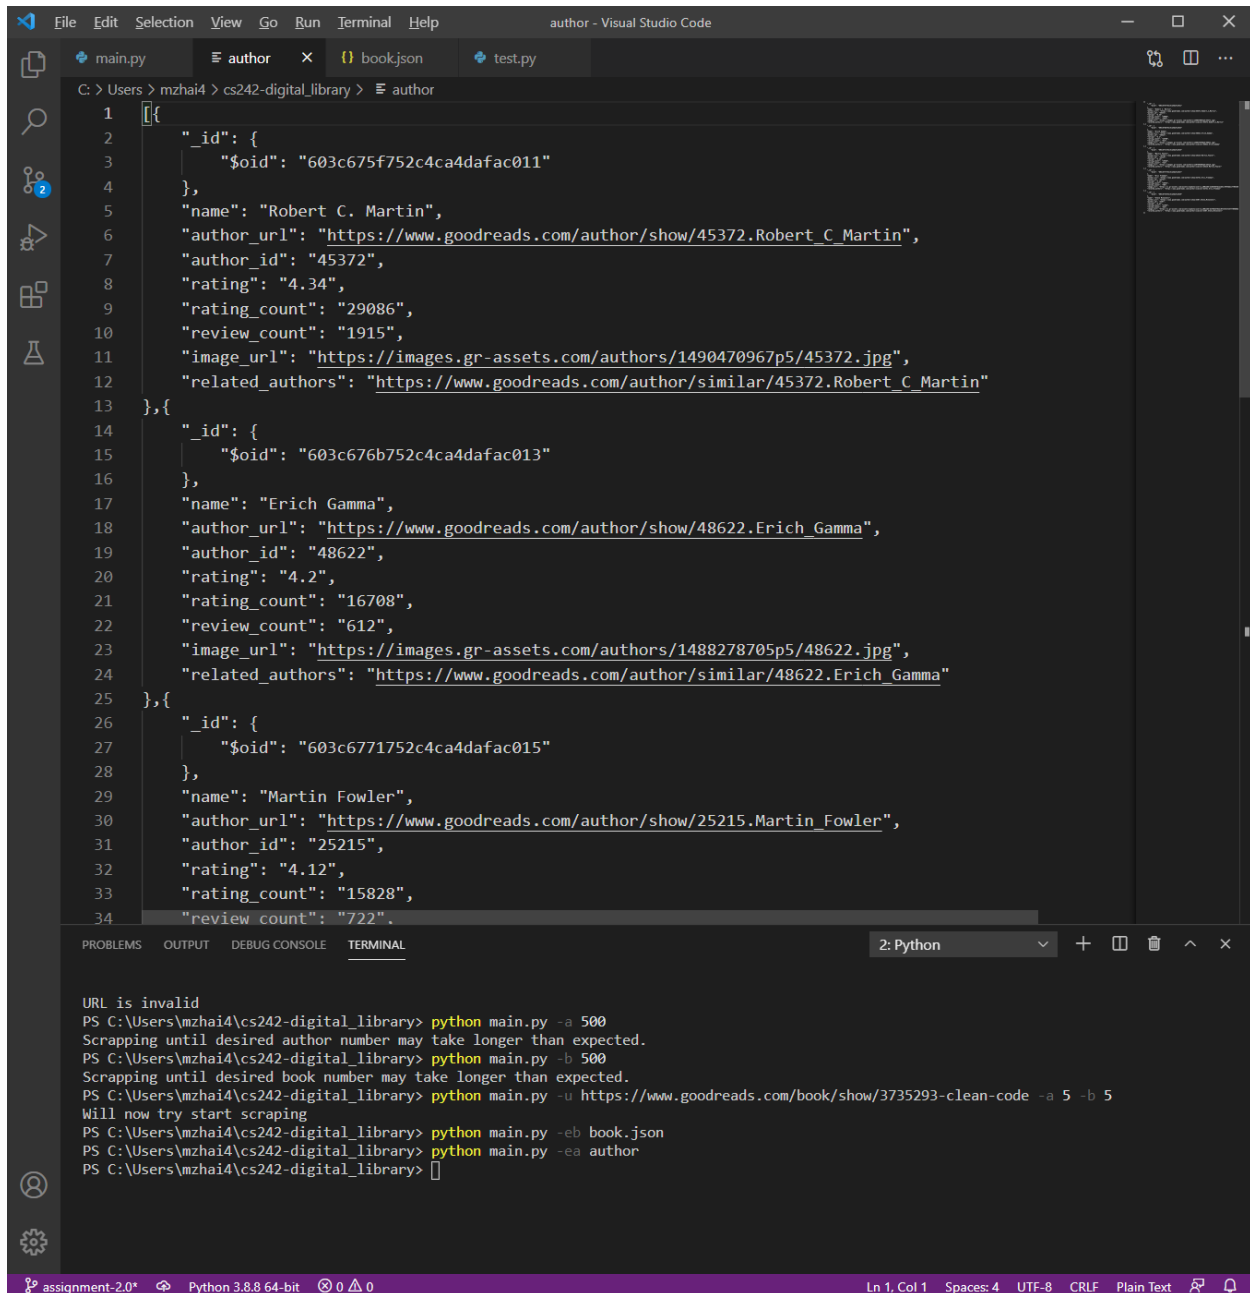

The screenshot shows a VS Code editor with a file named `book.json` open. The file contains a JSON array of book objects. The first object is for 'Clean Code: A Handbook of Agile Software Craftsmanship' by Robert C. Martin. The second object is for 'Design Patterns: Elements of Reusable Object-Oriented Software' by Erich Gamma. The third object is partially visible. The terminal at the bottom shows the execution of a Python script `main.py` with various command-line arguments, including `-eb book.json`, which successfully exports the database to the specified JSON file.

PS C:\Users\mzhai4\cs242-digital_library> python main.py -eb book.json
PS C:\Users\mzhai4\cs242-digital_library>
```

For example, the author file does not have “.json “, but still the file will be written.

The image shows a Visual Studio Code editor window with a file named 'author' open. The file contains a JSON array of three author objects. The first object is for Robert C. Martin, the second for Erich Gamma, and the third for Martin Fowler. The terminal window at the bottom shows the execution of a Python script named 'main.py' with various command-line arguments. The output of the script indicates that it is scraping data until a desired author number is reached, and then it starts scraping book data. The status bar at the bottom shows the file encoding as UTF-8, the line ending as CRLF, and the text format as Plain Text.
